RE: Safetec Spill Response Kits

We want to assure our customers that our spill kits are built to last, with components that maintain their efficacy when stored under proper conditions.

Our spill kits do not come with expiration dates, as many components, such as gloves, gowns, and respirators, are designed to last indefinitely when stored in the proper conditions, away from direct sunlight or extreme temperatures.

Regarding specific components that can be found in some of our kits:

- **SaniZide Pro1® Wipes:** The liquid formulation remains stable when stored appropriately and does not require expiration dating. Our SaniZide Pro 1® Surface Disinfectant liquid formulation has been assessed to be stable for up to three years from the manufacture date, with optimal use recommended within that timeframe.
- **p.a.w.s.® Antimicrobial Hand Wipes & Hand Sanitizer:** Our hand sanitizer and p.a.w.s.® antimicrobial wipes adhere to FDA regulations, with stability supported by our data for up to three years. These products do not have dosage limitations and remain effective within the specified timeframe.
- **Solidifiers:** As a non-regulated item with no active ingredients or claims, solidifiers do not require expiration dating. Proper storage in a cool, dry environment ensures their usability indefinitely.

We encourage our customers to exercise their best judgment when assessing their products and to inspect the contents of their kits periodically.
